Stage 1

Literature review

Analysis of previous studies to identify the metrics, methodologies and research gaps related to incorporating intermittency into energy storage sizing.

Stage 2

Modelling

Development of a methodology to quantify the intermittency of photovoltaic generation and incorporate it into the sizing of BESS.

Stage 3

Case study

Application of the proposed methodology to different photovoltaic generation profiles in Colombia, to analyse how different resource levels and intermittency patterns affect sizing.

Stage 4

Structuring of the thesis

Article 1

Article 2
